

LoginActivity

The app launches to a log in screen. Here the user can choose a user name which will be shown on the home page and as the name of the author for all posts the user creates.

Logging in also allows the user to edit the comments that he/she posted.

From the main screen, the user can also view a list of his favorites by swiping from right to left.

After logging in, the user will see all the latest and greatest top level comments, or topics (sorted by default). Each post displays a thumbnail of the photo (if any), the title, the number of replies (not nested), the rating of the topic, the author of the topic, the location of the topic, and the date the topic was created.

On the menu bar the user can select the options icon to view an options screen as shown in the following page.

After clicking on the select menu, the user has various options. Here the user can choose to log in as a different user, or sort the top level comments by various criterion.

On the top of the page, the add icon can be selected to create a new topic as is shown in the following image.

New Topic

Cancel

This is the page where a user can create a new top level comment. The user can create a title, message text, or optionally edit a location (it will default to the phone's current location). If the user wishes there is also the option to add a photo from an album or take one with the built in camera.

Once the user is finished, the post button will add the topic to the previous screen.

The Distance Button can be clicked to edit the location of the post. After clicking this button, it brings the user to the following page.

LocationActivity

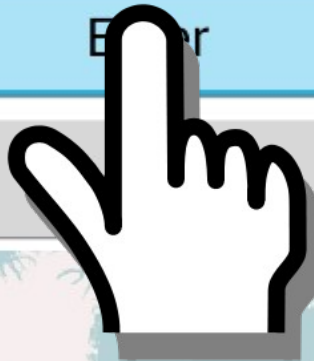

(0.0, 0.0)

Latitude: -84.9901

Longitude: -21.09375

Enter

Here the user can manually enter in a latitude and longitude for their post. Alternately, they can choose to tap on the map to approximate their latitude and longitude.

Here, a full screen view of the topic can be seen. A user can vote on the topic by using the up and down thumbs, or toggle the topic as a favorite by clicking the star icon. We will discuss favorite comments later.

Or the user can choose to view a full screen view of one of the topic's replies by tapping on it; this is shown on the following page.

The page allows for scrolling to view all of the replies it may have.

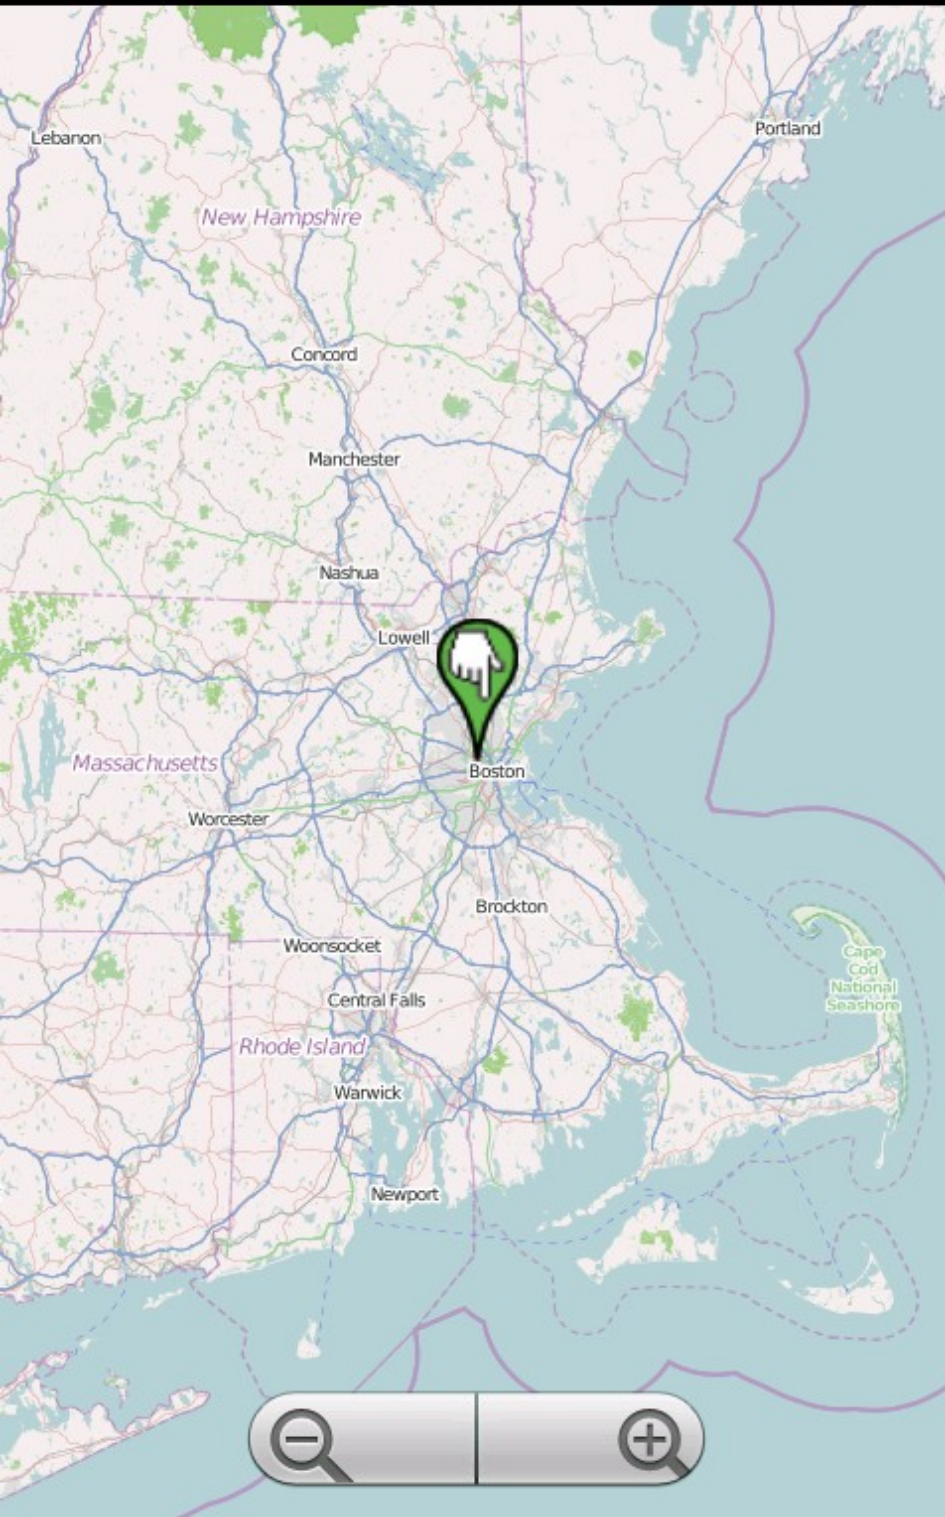

Here, a reply to a topic can be seen. It is almost identical to viewing a topic, but since replies do not have titles, a preview of the comment is shown.

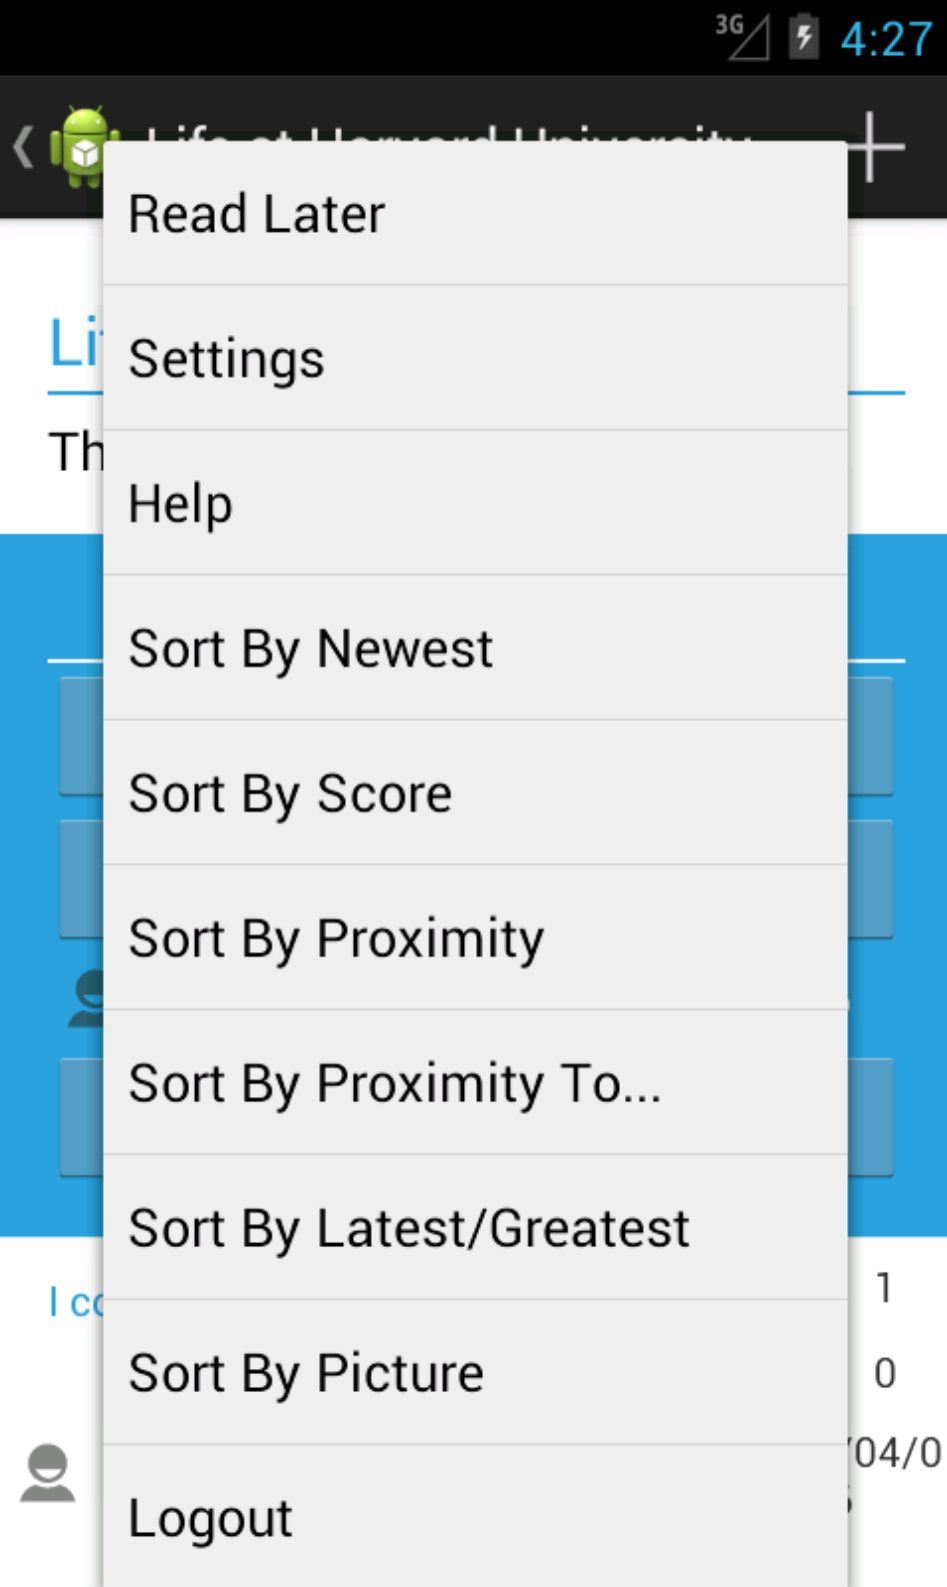

Child comments can be added identically like this by pressing the add icon as shown in the picture.

The user can also choose to click on the distance button to view the location on a map as shown in the following picture.

If the user is viewing a comment that he/she authored, there will be an edit button. Clicking it will bring you back to the create page shown before, but with the fields updated with the posts information.

Here the user can view the post on a map. If the user selected the distance icon on a Top Level Comment, then the locations of it, and all it's replies will be displayed on the map.

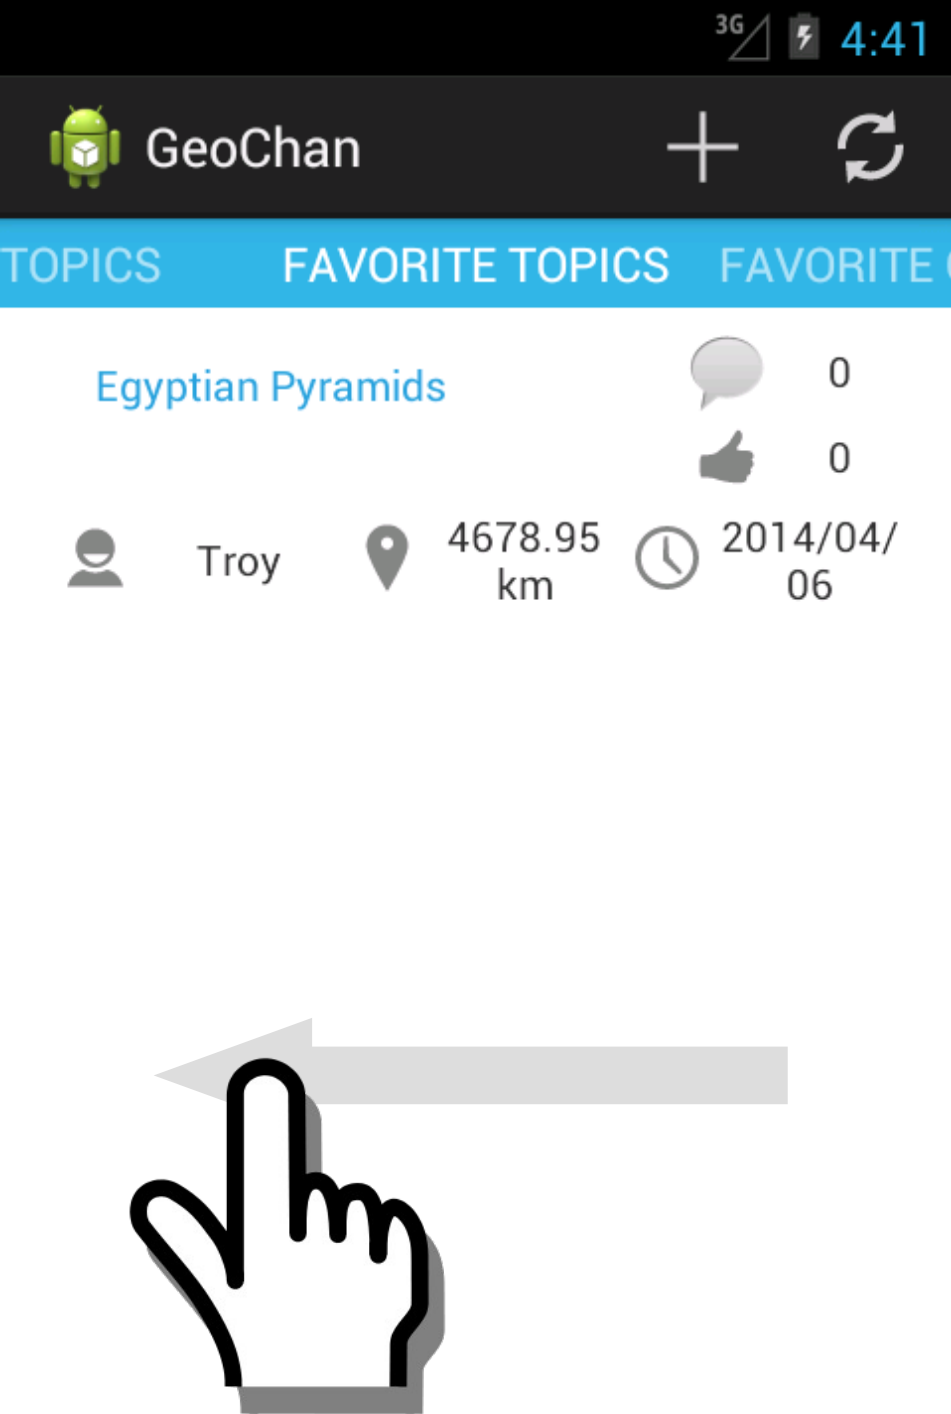

While viewing a topic or a reply, the user is able to select the topic for read later, view the settings page, or view the help section.

Here, the user can also sort the posts and the topics according to certain parameters shown in the picture.

Or, the user can return to the main log in page to sign in with a different user name.

From the main screen, the user can also view a list of his favorite topics by swiping from right to left.

By swiping right to left, the user can view, in order: Topics, Favorite Topics, Favorite Comments, Read Later Topics, and Read Later Comments.

They interact the same way as on the main view, but are available without internet connectivity.

Changes made while offline will be pushed once a connection is reestablished.
